

Lake George area stores that carry Phosphorus-Free Fertilizer

Phosphorus (P) is a plant nutrient found in lawn and garden fertilizers, manure, as well as human and animal waste. However, most lawns don't actually need additional phosphorus to be healthy and green all summer long. And when it runs off into nearby waterways, the phosphorus feeds algal blooms and weed growth. These weeds and the water quality problems that occur when they decompose and use up all the oxygen in the water can harm fish and other animals and limit everyone's use and enjoyment of the water.

You can still have a beautiful lawn and keep "P" from polluting the water by using Phosphorus-Free Fertilizer. Remember to look for the Middle Number! The three numbers on fertilizer bags show the N-P-K nutrient analysis. The middle number is the phosphate content. A "zero" in the middle means that it is phosphorus-free.

By carrying phosphorus-free fertilizers, these retailers are helping support healthy lawns without compromising water quality. If you don't see P-free fertilizer at your local retailer, ask them to carry it, or try one of these sources.
